

Global agribusiness Viterra chose Matrix Security division Technology Solutions to design and install electronic security systems for their major new facility in Wiri, South Auckland. An electric security fence backed up by the use of CCTV cameras incorporates video analytics to detect intruders and provides perimeter protection. Further internal CCTV cameras enable Viterra operators to supervise plant operations in the highly automated plant. An integrated access control and intruder detection system monitors entry to the main building. Access to the site is through motorised gates and uses a cellular phone interface with the security system. Both the access control and the CCTV systems are remotely monitored by Matrix Security after hours.

“ Matrix Security’s Technology Solutions helped us to navigate our way through quite comprehensive security system options and they designed a solution that addressed all our concerns. This high tech security design and install ensures Viterra is confident we have the best security system for our needs.”
